CLINICSCRIBE · PROBLEM STATEMENT

A GP needs a trustworthy record from every consult, without patient data leaving the clinic.

Notes by hand

Rules checked late

Audio off-site

ClinicScribe: GP consult audio in, a checked SOAP note, MC and panel claim out.

TEAM OMEGA VISION

Three problems, solved in four steps

PROBLEMS WE SOLVE

PROBLEM	CLINICSCRIBE
Notes after every visit Consults are typed up by hand as a SOAP note, MC and claim.	**Drafted from the conversation** Speaker-labelled transcript to SOAP note and MC.
Rules checked too late Allergy, dose and panel limits slip through, such as a 3-day MC on a 2-day panel.	**Checked before approval** Code-based checks and a verifier pass raise flags with fixes.
Audio leaves the clinic Cloud scribes send sensitive recordings off-site.	**100% local, RM0 API cost** Runs on the ATOM with Wi-Fi off.

HOW IT WORKS

1. **Hear**
   Sortformer splits speakers, Nemotron ASR transcribes each turn.
2. **Draft**
   Nemotron 3.5 Lightning calls five tools to write the SOAP note and MC.
3. **Check**
   Panel and drug rules run in code, a verifier reviews the draft.
4. **Approve**
   The doctor reviews flags and approves.

FLAG · FROM THE DEMO

3-day MC exceeds the panel limit of 2 days. Reduce to 2 days or add a reason.

Local NVIDIA models, with facts checked by code

AI CAPABILITY

1 Diarization
Sortformer: who is speaking, and when.

2 Speech to text
Nemotron 3.5 ASR Streaming 0.6B, per turn, with timestamps.

3 Agent
Nemotron 3.5 Lightning (30B MoE, 3B active) labels Doctor and Patient, calls tools, writes the note.

4 Verifier
A second Lightning call flags anything unsupported or missing.

TECHNICAL IMPLEMENTATION

Upload ➡ Diarize ➡ ASR ➡ Agent ➡ Review

`queued → diarizing → transcribing → summarising → done`

Five tools

get_panel_rules · check_drug · draft_mc · flag · write_soap_note

Facts from code, not memory

Allergies, max dose, interactions, MC dates and panel limits are computed in Python over local JSON.

SOFTWARE STACK

GIGABYTE AI TOP ATOM (GB10) | vLLM · OpenAI-compatible API | Python · FastAPI | async_stt · Ray Serve + Celery | NVIDIA Sync

IMPACT AND FEASIBILITY

No API bill, no data leaving, errors caught before approval

RM0

API cost per consult. No cloud model or speech service.

Wi-Fi off

Runs offline, so patient audio stays on the clinic’s machine.

Flagged

Rule breaks surface before the doctor approves.

FEASIBILITY · WORKING TODAY

- Demo runs end to end on the ATOM with Wi-Fi off
- Model and port set by environment variables
- Tests run without a GPU

FEASIBILITY · NEEDED FOR A PILOT

- Real formulary and panel rules in place of synthetic JSON
- Clinician validation of notes, MCs and flags
- Data protection and regulatory review

MEASURED LIVE IN THE DEMO

Audio minutes processed | Wall time | Speed vs real time | Lightning tokens/s | Consults done

PITCH

ClinicScribe turns a GP consult into a checked SOAP note, MC and panel claim. Nothing leaves the clinic.

Three local NVIDIA models, five verified tools, one doctor approval.

TEAM OMEGA VISION

LIVE DEMO · WI-FI OFF

1. Start Lightning and the demo server. The badge turns LIVE.
2. Drop the hero consult: transcript, tool calls, SOAP note.
3. Show the flag: a 3-day MC breaks the panel’s 2-day limit.
4. Press Approve.
5. Drop the batch of short files: queue and metrics bar.
